

TraceLink vs Mederti

Competitive comparison — data visibility & interaction model

Prepared 3 June 2026

TraceLink's "AI mode" search and its Product Availability Intelligence (PAI) engine occupy the same conceptual space as Mederti: natural-language, persona-led entry into drug-shortage and sourcing intelligence. The two solve it from opposite ends of the data spectrum. This sheet compares what each can see and how each is *used*.

A. Data visibility

Dimension	TraceLink (PAI + Amadeus)	Mederti	Edge
Primary data source	Proprietary network master data — POs, inventory levels, shipment notices (via MINT) from 300k+ companies, 35B+ serialized products	~29k shortage events scraped from ~35 national regulators + recalls, ATC, RxNorm, pricing, 124 intelligence sources	Different moats
Shortage signal origin	ASHP feed (US-only) + inferred network demand/supply imbalance	Regulator notices across AU, US, EU, UK, CA, JP, KR, BR, ZA, etc. — natively multi-country	Mederti
Granularity	NDC-level (specific package / manufacturer)	INN / molecule-level (salt-stripped, UNII/RxNorm-resolved), rolling brands → generic	Split
Who can see what	Gated — you only see NDCs your company is licensed to view; requires network membership	Fully open — any persona queries the whole global dataset, no membership	Mederti
Geographic scope	US-centric (ASHP); network global but shortage prediction is US	~35 countries, multi-country drug universe	Mederti
Supply-side / sourcing data	"Alternate supply source" = other members on their network	API supplier concentration from FDA DMF, DECRS country-of-manufacture, WHO-PQ API makers — open & auditable	Different
Recall / causal links	Not a stated feature	Recalls + recall → shortage causal links	Mederti
Transparency / citability	Black-box ML over proprietary data — not externally citable	Every answer traces to a named regulator source; methodology explainable	Mederti
Real-time transaction visibility	Yes — live POs, inventory, shipments	No — we do not see commercial transactions	TraceLink
Update cadence	Near-real-time (network transactions)	Daily scrapers (staggered cron)	TraceLink

B. Interaction model

Dimension	TraceLink	Mederti	Edge
Conversational surface	"AI mode" search box (lead-gen) → Amadeus chat	Persona-aware /chat, DB-grounded	Comparable
What the chat answers	Phase-zero Amadeus = docs/help bot over TraceLink University content; says "I don't understand" on unknown queries	Synthesizes over 29k live shortage events, drug lookups & macro intelligence catalogue — answers the domain, not the manual	Mederti

Dimension	TraceLink	Mederti	Edge
LLM	OpenAI-based, heavy guardrails, narrow scope to avoid hallucination	Claude Opus, tool-using, web-search enabled, DB-grounded with source-priority guidance	Mederti
Predictive output UX	PAI dashboard — red/yellow/green daily traffic signals, 90-day NDC forecasts, production recommendations	Persona views + predictive-signals (peer-set lead-time) + INN vulnerability score	Split
Persona awareness	Role = your network position (manufacturer / distributor)	Explicit personas: pharmacist, procurement, supplier, doctor, gov, hospital — UI auto-routes	Mederti
Agentic / task execution	OPUS Agents — no-code agents that execute supply tasks (monitor orders, verify lead times, flag exceptions)	Chat is advisory; agentic roadmap planned but not shipped	TraceLink
Forward-looking framing	“90 days in advance, >80% accuracy” headline	Vulnerability / fragility model + peer lead-time signals (earlier-stage)	Split
Who can use it	Existing paying network members	Anyone, public site	Mederti

Synthesis

TraceLink sees fewer drugs, deeper — real transactions, NDC-level, US, members-only, black-box, but it can *execute*. **Mederti sees more drugs, transparently** — global regulators, molecule-resolved, open, cited, but advisory with no transaction-level demand signal.

Their unbeatable advantage is live transaction visibility. Ours is **breadth + neutrality + explainability**. Tellingly, the trigger query — *“I’m an importer in Australia, how can you help me source shortages?”* — sits **outside TraceLink’s wheelhouse**: that importer isn’t on their network, AU isn’t in their ASHP-driven prediction scope, and phase-zero Amadeus would likely answer “I don’t understand.” It is squarely Mederti’s supplier / importer persona.

Sources: TraceLink PAI product page & FAQ (data inputs: TraceLink network + ASHP, licensed NDCs); Amadeus and OPUS Agents press releases; “90 days in advance, >80% accuracy” announcement. Mederti side grounded in the live schema and codebase.
